In 2017, two-thirds of U.S. adults get news from social media

% of U.S. adults who get news from social media sites ...

Source: Survey conducted Aug. 8-21, 2017.
“News Use Across Social Media Platforms 2017”

- ▶ 67% of Americans get news on social media (Pew Research)
- ▶ 58% of EU citizens active on social media & find it useful to get news on national political matters (Eurobarometer, Fall 2017)
- ▶ Social media: top source of news for U.S. young adults (Pew)

Shift in communication patterns

Digital footprints of human behavior

Hello!

About me: Pablo Barberá

- ▶ Assistant Professor of Computational Social Science at the [London School of Economics](#)
 - ▶ Previously Assistant Prof. at [Univ. of Southern California](#)
 - ▶ PhD in Politics, [New York University](#) (2015)
 - ▶ Data Science Fellow at [NYU](#), 2015–2016
- ▶ [My research:](#)
 - ▶ Social media and politics, comparative electoral behavior
 - ▶ Text as data methods, social network analysis, Bayesian statistics
 - ▶ Author of R packages to analyze data from social media
- ▶ [Contact:](#)
 - ▶ P.Barbera@lse.ac.uk
 - ▶ www.pablobarbera.com
 - ▶ [@p_barbera](https://twitter.com/p_barbera)

This course

Two central questions:

1. **What** type of social science questions can I answer with social media data?
2. **How** would I answer those questions? What methods and tools would I use?

Today: social media research

- ▶ Research opportunities and challenges
- ▶ Automated web data collection

Tomorrow

- ▶ Collecting data from social media
- ▶ Discovery in social media text

Saturday

- ▶ Querying large-scale databases

Course philosophy

How to learn the techniques in this course?

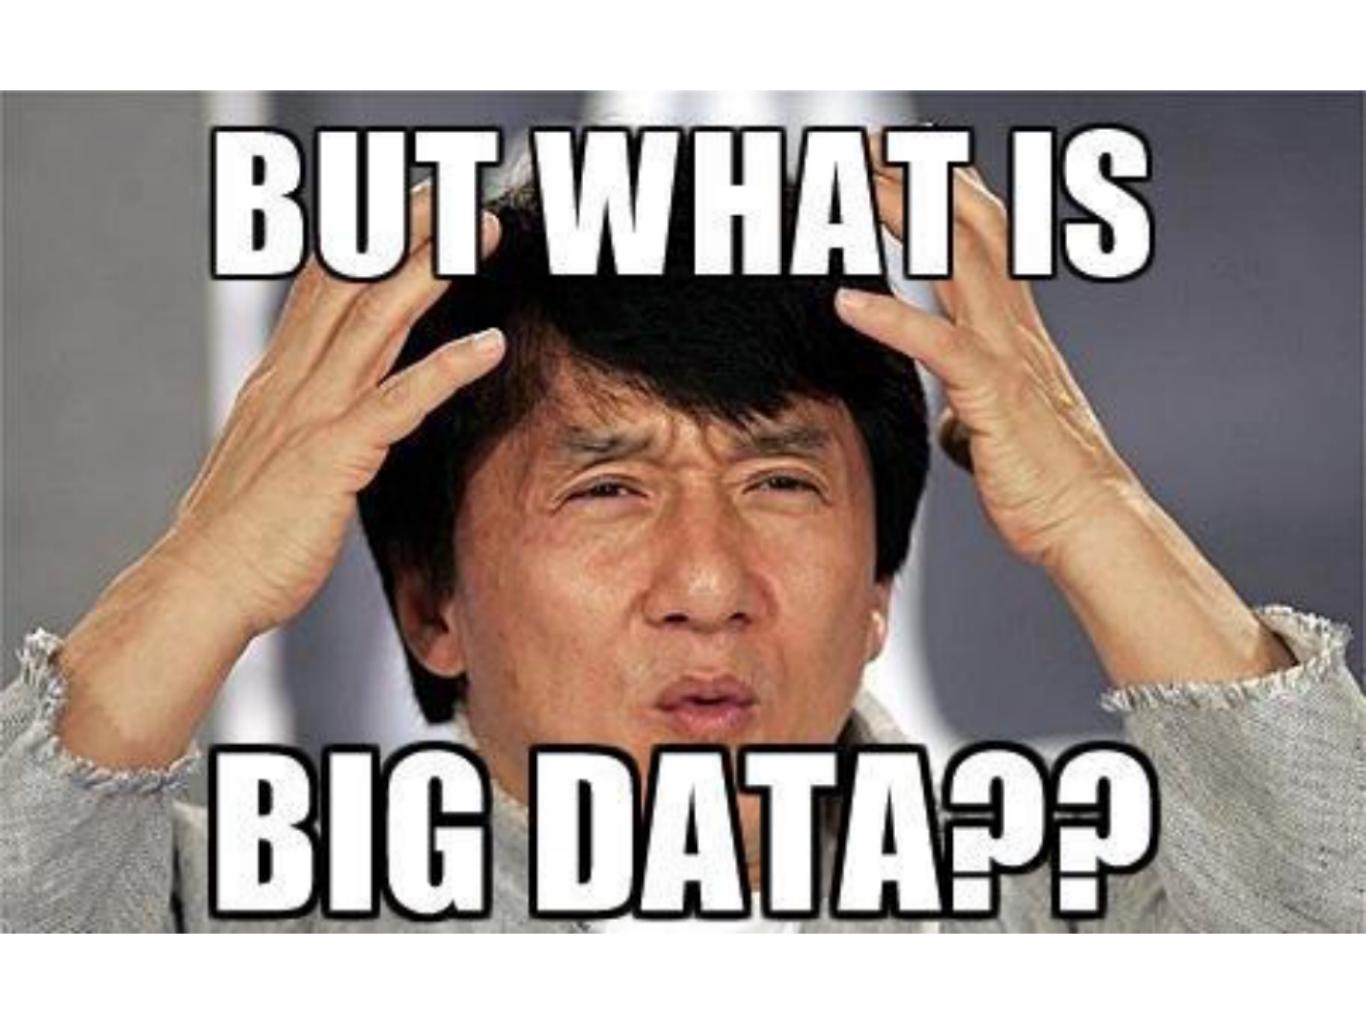

- ▶ Lecture approach: not ideal for learning how to code
- ▶ You can only **learn by doing**.
- We will cover each concept three times during each session
 1. Introduction to the topic (40 minutes)
 2. Guided coding session (40 minutes)
 3. Coding challenges (40 minutes)
 4. Solution to coding challenges (30 minutes)
 - Repeat twice per day
- ▶ Warning! We will **move fast**.

Your turn!

1. Name?
2. Affiliation? Background?
3. Summarize your research interests in 5 words

Social Media & Big Data Research: Opportunities and Challenges

A photograph of Jackie Chan from the chest up. He has dark hair and is looking directly at the camera with a confused expression. His hands are raised to his head, with his fingers pointing upwards. He is wearing a light-colored, possibly white, collared shirt.

BUT WHAT IS

BIG DATA???

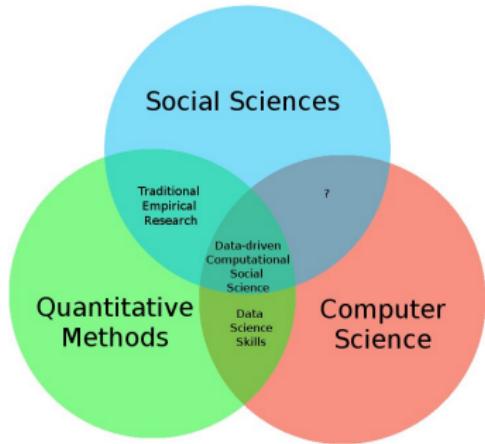

The Three V's of Big Data

Dumbill (2012), Monroe (2013):

1. **Volume**: 6 billion mobile phones, 1+ billion Facebook users, 500+ million tweets per day...
2. **Velocity**: personal, spatial and temporal granularity.
3. **Variability**: images, networks, long and short text, geographic coordinates, streaming...

Big data: data that are so large, complex, and/or variable that the tools required to understand them must first be invented.

Computational Social Science

*"We have **life in the network**. We check our emails regularly, make mobile phone calls from almost any location ... make purchases with credit cards ... [and] maintain friendships through online social networks ... These transactions leave digital traces that can be compiled into comprehensive pictures of both individual and group behavior, with the potential to transform our understanding of our lives, organizations and societies".*

Lazer et al (2009) Science

Digital trace data

What are the main advantages of using social media data to study human behavior?

1. Unobtrusive data collection at scale, e.g. in study of networks, censorship
2. Homogeneity in data format across actors, countries, and over time, e.g. in study of political rhetoric
3. Temporal and spatial data granularity, e.g. in study of geographic segregation
4. Increasing representativeness of social media users, e.g. in study of political elites

Social media research

Two different approaches in the growing field of social media research:

1. Social media as a new source of data
 - ▶ Behavior, opinions, and latent traits
 - ▶ Interpersonal networks
 - ▶ Elite behavior
 - ▶ Affordable field experiments
2. How social media affects social behavior
 - ▶ Collective action and social movements
 - ▶ Political campaigns
 - ▶ Social capital and interpersonal communication
 - ▶ Political attitudes and behavior

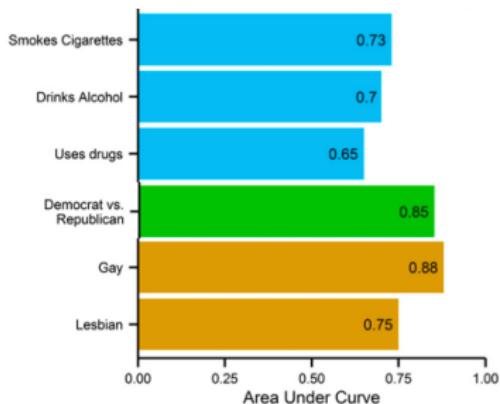

Social media research

Two different approaches in the growing field of social media research:

1. Social media as a new source of data

slacktivism?

Why the revolution will not be tweeted

*When the sit-in movement spread from Greensboro throughout the South, it did not spread indiscriminately. It spread to those cities which had preexisting “movement centers” – a **core of dedicated and trained activists** ready to turn the “fever” into action.*

*The kind of activism associated with social media isn’t like this at all. [...] Social networks are effective at increasing participation – by **lessening the level of motivation** that participation requires.*

Gladwell, Small Change (New Yorker)

*You can’t simply join a revolution any time you want, contribute a comma to a random revolutionary decree, rephrase the guillotine manual, and then slack off for months. **Revolutions prize centralization and require fully committed leaders**, strict discipline, absolute dedication, and strong relationships.*

*When every node on the network can send a message to all other nodes, **confusion is the new default equilibrium**.*

Morozov, The Net Delusion: The Dark Side of Internet Freedom

The critical periphery

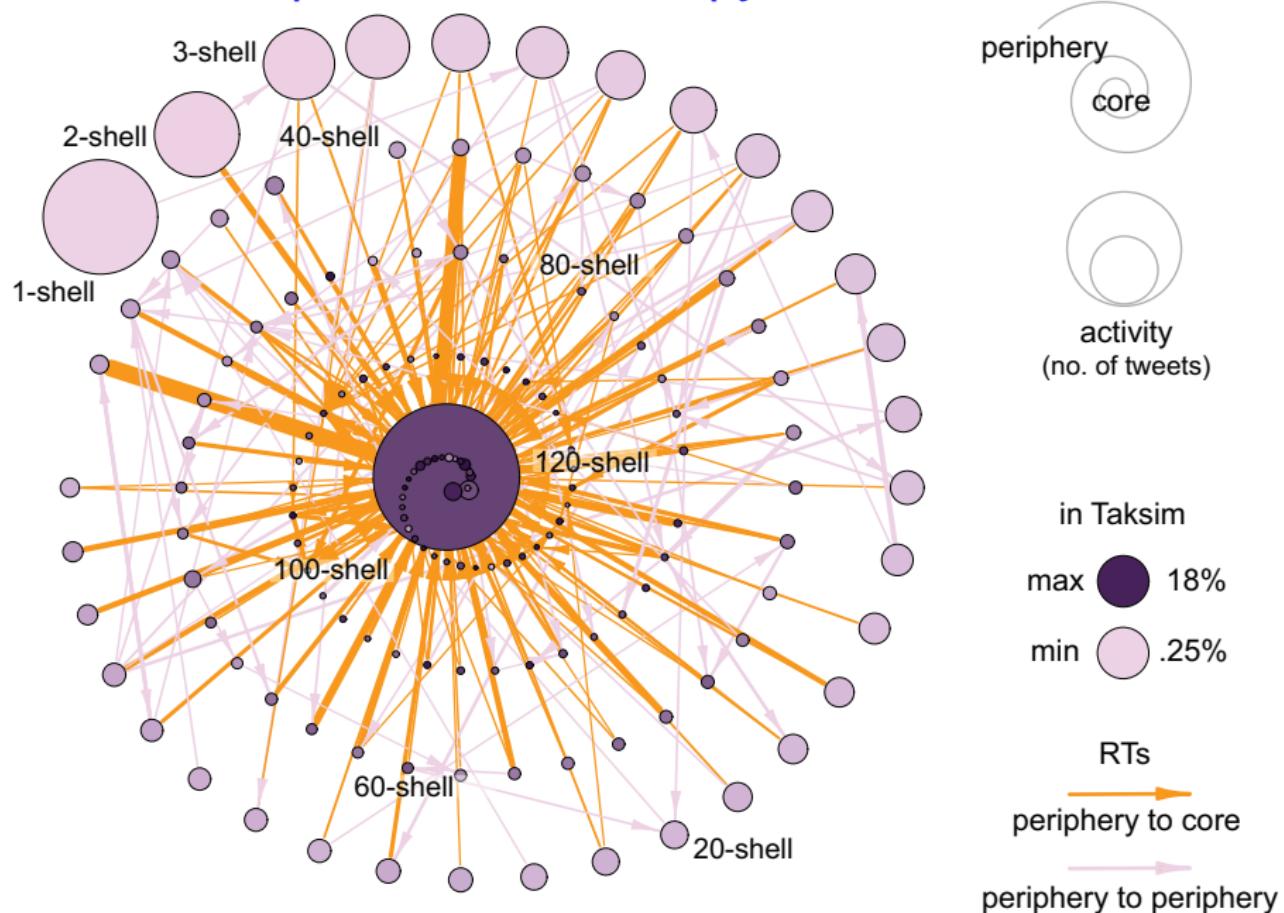

RESEARCH ARTICLE

The Critical Periphery in the Growth of Social Protests

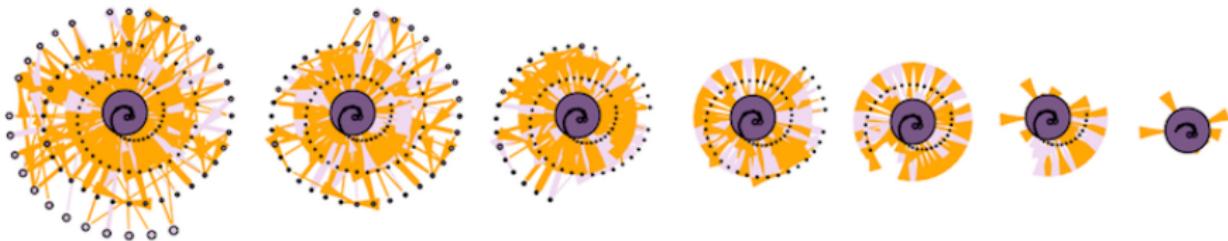

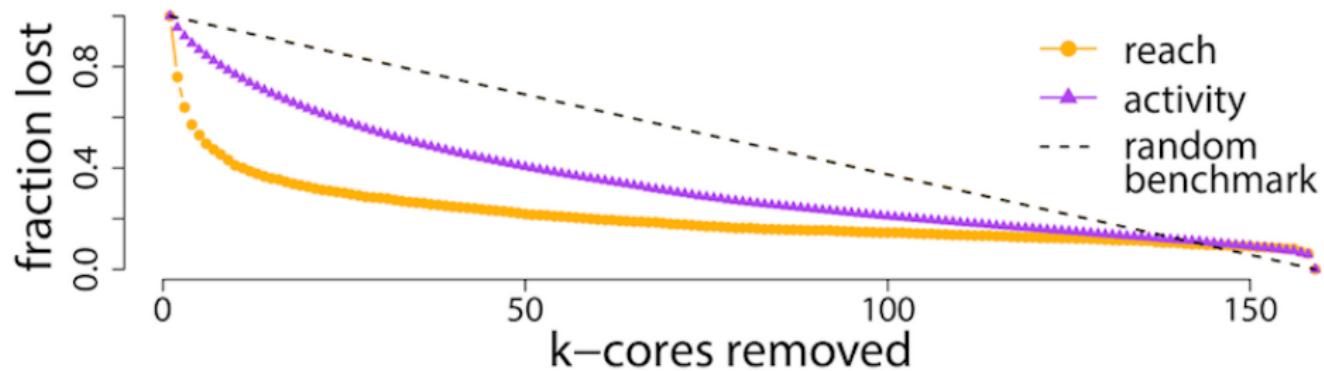

Pablo Barberá^{1*}, Ning Wang², Richard Bonneau^{3,4}, John T. Jost^{1,5,6}, Jonathan Nagler⁶, Joshua Tucker⁶, Sandra González-Bailón^{7*}

- ▶ Structure of online protest networks:
 1. Core: committed minority of resourceful protesters
 2. Periphery: majority of less motivated individuals
- ▶ Our argument: key role of peripheral participants
 1. Increase reach of protest messages (positional effect)
 2. Large contribution to overall activity (size effect)

k-core decomposition of #OccupyGezi network

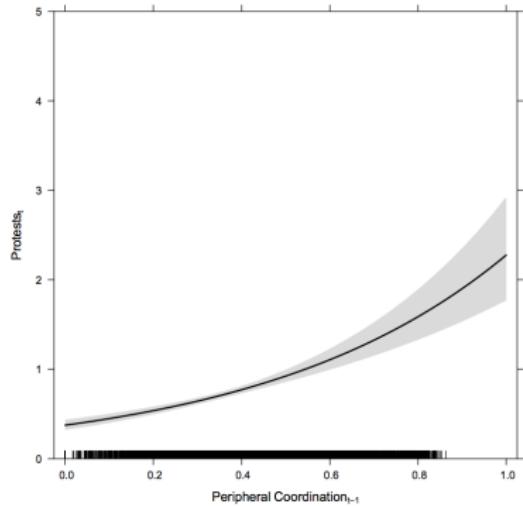

Relative importance of core and periphery

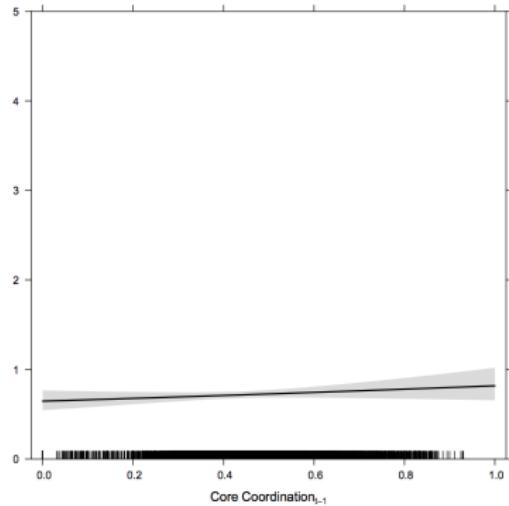

reach: aggregate size of participants' audience

activity: total number of protest messages published (not only RTs)

Peripheral mobilization during the Arab Spring

(a) Increase in protest as peripheral coordination increases

(b) Coordination does not come through core individuals

Steinert-Threlkeld (APSR 2017) “Spontaneous Collective Action”

Social media and democracy

FROM LIBERATION TO TURMOIL: SOCIAL MEDIA AND DEMOCRACY

*Joshua A. Tucker, Yannis Theocharis, Margaret E. Roberts,
and Pablo Barberá*

"How can one technology – social media – simultaneously give rise to hopes for liberation in authoritarian regimes, be used for repression by these same regimes, and be harnessed by antisystem actors in democracy? We present a simple framework for reconciling these contradictory developments based on two propositions: 1) that social media give voice to those previously excluded from political discussion by traditional media, and 2) that although social media democratize access to information, the platforms themselves are neither inherently democratic nor nondemocratic, but represent a tool political actors can use for a variety of goals, including, paradoxically, illiberal goals."

Journal of Democracy, 2017

What are the most important challenges when working with social media data?

Social media data and social science: challenges

1. Big data, big bias?
2. The end of theory?
3. Spam and bots
4. The privacy paradox
5. Generalizing from online to offline behavior
6. Ethical concerns

1. Big data, big bias?

SOCIAL SCIENCES

Social media for large studies of behavior

Large-scale studies of human behavior in social media need to be held to higher methodological standards

By Derek Ruths^{1*} and Jürgen Pfeffer²

On 3 November 1948, the day after Harry Truman won the United States presidential elections, the *Chicago Tribune* published one of the most famous erroneous headlines in newspaper history: “Dewey Defeats Truman” (1, 2). The headline was informed by telephone surveys, which had inadver-

different social media platforms (8). For instance, Instagram is “especially appealing to adults aged 18 to 29, African-American, Latinos, women, urban residents” (9) whereas Pinterest is dominated by females, aged 25 to 34, with an average annual household income of \$100,000 (10). These sampling biases are rarely corrected for (if even acknowledged).

Proprietary algorithms for public data. Platform-specific sampling problems, for example, the highest-volume source of pub-

The rise of “embedded researchers who have special relationships with providers that give them access to platform-specific data, algorithms, and resources” is creating a diverse media research community. Such researchers, for example, can see a platform’s workings and make accommodations that may not be able to reveal their commercial or the data used to generate their findings.

Ruths and Pfeffer, 2015, “Social media for large studies of behavior”, *Science*

Big data, big bias?

Sources of bias (Ruths and Pfeffer, 2015; Lazer et al, 2017)

- ▶ Population bias
 - ▶ Sociodemographic characteristics are correlated with presence on social media
- ▶ Self-selection within samples
 - ▶ Partisans more likely to post about politics (Barberá & Rivero, 2014)
- ▶ Proprietary algorithms for public data
 - ▶ Twitter API does not always return 100% of publicly available tweets (Morstatter et al, 2014)
- ▶ Human behavior and online platform design
 - ▶ e.g. *Google Flu* (Lazer et al, 2014)

1. Big data, big bias?

Reducing biases and flaws in social media data

DATA COLLECTION

- 1. Quantifies platform-specific biases (platform design, user base, platform-specific behavior, platform storage policies)
- 2. Quantifies biases of available data (access constraints, platform-side filtering)
- 3. Quantifies proxy population biases/mismatches

METHODS

- 4. Applies filters/corrects for nonhuman accounts in data
- 5. Accounts for platform and proxy population biases
 - a. Corrects for platform-specific and proxy population biases
OR
 - b. Tests robustness of findings
- 6. Accounts for platform-specific algorithms
 - a. Shows results for more than one platform
OR
 - b. Shows results for time-separated data sets from the same platform
- 7. For new methods: compares results to existing methods on the same data
- 8. For new social phenomena or methods or classifiers: reports performance on two or more distinct data sets (one of which was not used during classifier development or design)

Issues in evaluating data from social media. Large-scale social media studies of human behavior should i address issues listed and discussed herein (further discussion in supplementary materials).

Ruths and Pfeffer, 2015, “Social media for large studies of behavior”,
Science

2. The end of theory?

Petabytes allow us to say: "Correlation is enough." We can stop looking for models. We can analyze the data without hypotheses about what it might show. We can throw the numbers into the biggest computing clusters the world has ever seen and let statistical algorithms find patterns where science cannot.

Chris Anderson, *Wired*, June 2008

Correlations are a way of catching a scientist's attention, but the models and mechanisms that explain them are how we make the predictions that not only advance science, but generate practical applications.

John Timmer, *Ars Technica*, June 2008

(Big) social media data as a complement - not a substitute - for theoretical work and careful causal inference.

3. Spam and bots

"Follow your coordinators. We need to start tweeting, all at the same time, using the hashtag #ItsTimeForMexico... and don't forget to retweet tweets from the candidate's account..."

Unidentified PRI campaign manager
minutes before the May 8, 2012 Mexican Presidential debate

3. Spam and bots

Ferrara et al, 2016, *Communications of the ACM*

4. The privacy paradox

Online data present a paradox in the protection of privacy: Data are at once too revealing in terms of privacy protection, yet also not revealing enough in terms of providing the demographic background information needed by social scientists.

Golder & Macy, Digital footprints, 2014

5. Generalizing from online to offline behavior

What makes online behavior different:

- ▶ Platform affordances may distort behavior
- ▶ Tools extend innate capacities (e.g. Dunbar's number)
- ▶ Anonymity encourages vitriol

6. Ethical concerns

1. Shifting notion of *informed consent*

Experimental evidence of massive-scale emotional contagion through social networks

Adam D. I. Kramer^{a,1}, Jamie E. Guillory^{b,2}, and Jeffrey T. Hancock^{b,c}

^aCore Data Science Team, Facebook, Inc., Menlo Park, CA 94025; and Departments of ^bCommunication and ^cInformation Science, Cornell University, Ithaca, NY 14853

Edited by Susan T. Fiske, Princeton University, Princeton, NJ, and approved March 25, 2014 (received for review October 23, 2013)

Emotional states can be transferred to others via emotional contagion, leading people to experience the same emotions without their awareness. Emotional contagion is well established in laboratory experiments, with people transferring positive and negative emotions to others. Data from a large real-world social network, collected over a 20-y period suggests that longer-lasting moods (e.g., depression, happiness) can be transferred through networks [Fowler JH, Christakis NA (2008) *BMJ* 337:a2338], although the results are controversial. In an experiment with people who use Facebook, we test whether emotional contagion occurs

demonstrated that (i) emotional contagion occurs via text-based computer-mediated communication (7); (ii) contagion of psychological and physiological qualities has been suggested based on correlational data for social networks generally (7, 8); and (iii) people's emotional expressions on Facebook predict friends' emotional expressions, even days later (7) (although some shared experiences may in fact last several days). To date, however, there is no experimental evidence that emotions or moods are contagious in the absence of direct interaction between experiencer and target.

On Facebook, people frequently express emotions, which are

2. Most personal data can be de-anonymized

“But the data is already public”: on the ethics of research in Facebook

Analyzing Social Media Data: First Steps

Why we're using R

- ▶ Becoming *lingua franca* of statistical analysis in academia
- ▶ What employers in private sector demand
- ▶ It's free and open-source
- ▶ Flexible and extensible through *packages* (over 10,000 and counting!)
- ▶ Powerful tool to conduct automated text analysis, social network analysis, and data visualization, with packages such as quanteda, igraph or ggplot2.
- ▶ Command-line interface and scripts favors reproducibility.
- ▶ Excellent documentation and online help resources.

R is also a full programming language; once you understand how to use it, you can learn other languages too.

Social Media & Big Data Research

Summer School in Survey Methodology

Universitat Pompeu Fabra, July 2-4 2018

Citizens across the globe spend an increasing proportion of their daily lives online. Their activities leave behind granular, time-stamped footprints of human behavior and personal interactions that represent a new and exciting source of data to study standing questions about political and social behavior. At the same time, the volume and heterogeneity of web data present unprecedented methodological challenges. The goal of this course is to introduce participants to new computational methods and tools required to explore and analyze Big Data from online sources using the R programming language. We will focus in particular on data collected from social networking sites, such as Facebook and Twitter, whose use is becoming widespread in the social sciences.

Each session will provide an overview of the literature and research methods on a particular theme to then dive into a specific application, documenting each step from data collection to the analysis required to test hypotheses related to core social science questions. Code and data for all the applications will be provided. The course will follow a “learning by doing” approach, and participants will be asked to complete a series of coding challenges.
